

LAB ACTIVITY

Perform a query with Wazuh.

STEP 1: I successfully deployed the Wazuh Virtual machine.

STEP 2: I successfully configured the Virtual machine.

STEP 3: I successfully configured a shared folder to get my data inside and then accessed the wazuh dashboard from my browser. After the VM boots, I logged in with root / wazuh (I use these root credentials to access logs). I Ran the following commands to get the correct permissions for the shared folder: `usermod -aG vboxsf root`, `reboot`. After the VM reboots, I logged back in (with root credentials above). I Ran the command `ip a` to find my VM's IP address. I Opened a web browser on my computer and went to <https://172.20.10.15> to Allow and log in to the Wazuh dashboard with admin / admin.

```
WAZUH Open Source Security Platform
https://wazuh.com
[wazuh-user@wazuh-server ~]$ ip a
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group default qlen 1000
    link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
    inet 127.0.0.1/8 scope host lo
        valid_lft forever preferred_lft forever
    inet6 ::1/128 scope host noprefixroute
        valid_lft forever preferred_lft forever
2: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc fq_codel state UP group default qlen 1000
    link/ether 08:00:27:68:ed:d8 brd ff:ff:ff:ff:ff:ff
    altname enp0s17
    inet 172.20.10.2/24 metric 1024 brd 172.20.10.15 scope global dynamic eth0
        valid_lft 3313sec preferred_lft 3313sec
    inet6 fe80::a00:2711:fe68:edd8/64 scope link proto kernel_ll
        valid_lft forever preferred_lft forever
```

STEP 4: Now that my VM is running, I can get the data in for analysis.

1. Access the Data: In the VM's command line, I ran `cd /media/sf_wazuh_tutorial_data`. The `sf_` prefix is added by VirtualBox to denote the shared folder.

```
valid_lft forever preferred_lft forever
[wazuh-user@wazuh-server ~]$ cd /media/sf_wazuh_tutorial_data
-bash: /media/sf_wazuh_tutorial_data: Is a directory
[wazuh-user@wazuh-server ~]$
```

2. Create Ingestion File: I Ran **nano ingest.yml** then inputted the following content.

```
GNU nano 8.3                                ingest.yml
filebeat.inputs:
- type: log
  enabled: true
  paths:
    - /media/sf_wazuh_tutorial_data/maillsv/*.log
    - /media/sf_wazuh_tutorial_data/vendor_sales/*.csv
    - /media/sf_wazuh_tutorial_data/www1/*.log
    - /media/sf_wazuh_tutorial_data/www2/*.log
    - /media/sf_wazuh_tutorial_daata/www3/*.log
output.logstash:
  hosts: ["localhost:5044"]
```

3. Run Ingestion: I Ran **/usr/share/filebeat/bin/filebeat -c ingest.yml -e**. The command processed my logs and sent them to the dashboard.
4. Verify & Analyze: After the command finishes, I went to my browser. I didn't see logs immediately, waited a few minutes then refreshed.
5. In the time range, I chose **Absolute**, selected a very old start date (e.g., January 1, 2000), and clicked Update.
